Pellet Greenhouse Directions

ONE Pour approximately 64 - 70 oz. of warm water over the grow pellets that are placed in the tray. When the pellets have expanded to 1.5" - 2" drain excess water from the tray.

TWO Gently press 1-2 seeds in each pellet. Lightly water with a misting spray bottle.

THREE Set greenhouse in a warm, bright location (indirect sunlight). When plants have grown and roots penetrate walls of pellet, remove weak plants leaving one strong plant in each pellet. After 5-6 weeks, transplant plants into larger container or directly outdoors.

TIP Soil quality is critical for success. Keep deep, rich soil moist - fertilize every 10 days during the growing season. Select a good warm sunny location with preferably a SW exposure. This will help ensure excellent results.
